DETAILED ACTION

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

1. Determining the scope and contents of the prior art.
2. Ascertaining the differences between the prior art and the claims at issue.
3. Resolving the level of ordinary skill in the pertinent art.
4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

Claims 1-7 are rejected under 35 U.S.C. 103(a) as being unpatentable over Hebert.

As per claim 1, Hebert teaches a refrigeration cycle comprising compressor 36, condenser 20, throttle valve 26, evaporator 30, and refrigerant-to-refrigerant heat exchanger 10, wherein the valve 26 is controlled in order to control the degree of subcooling by the internal heat exchanger. Hebert does not teach a liquid receiver, however official notice is taken that liquid receivers are common and well-known in the art of refrigeration systems and would have been obvious to one of ordinary skill in the art at the time the invention was made to combine with the system of Hebert for the purpose of separating liquid & gaseous refrigerant at the outlet of the condenser.

Art Unit: 3744

As per claim 2, Hebert teaches valve 26 being downstream of heat exchanger 10 and upstream of evaporator 30.

As per claim 3, Hebert teaches high and low pressure conduits in heat exchanger 10 (see Figures 2-5).

As per claims 4 and 5, official notice is taken that these are common types of heat exchange structures that would have been obvious to apply to the heat exchanger of Hebert for the simple purpose of providing efficient heat exchange between the high and low sides.

As per claims 6 and 7, Hebert teaches a high pressure pipe connecting the heat exchanger 10 and the evaporator 30, and throttle 26 being disposed on that pipe (Figures 2-5).

Allowable Subject Matter

Claims 8 and 9 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.
